

FIRST UNIT PORTFOLIO

Student's name: ESPARZA ESTRADA CRISTOPHER ALAN

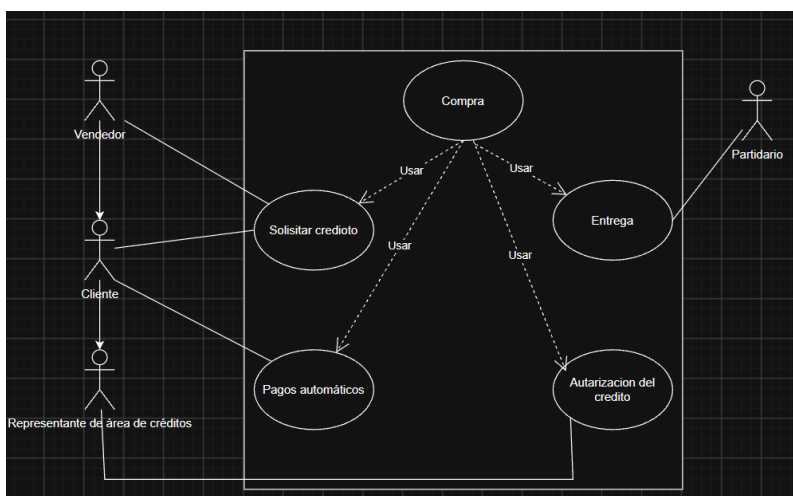

Teacher's name: DANIEL ARMANDO RIOS RIVERA

cours: OBJECT-ORIENTED PROGRAMING

DIAGRAM OF USE CASES (Online shopping).

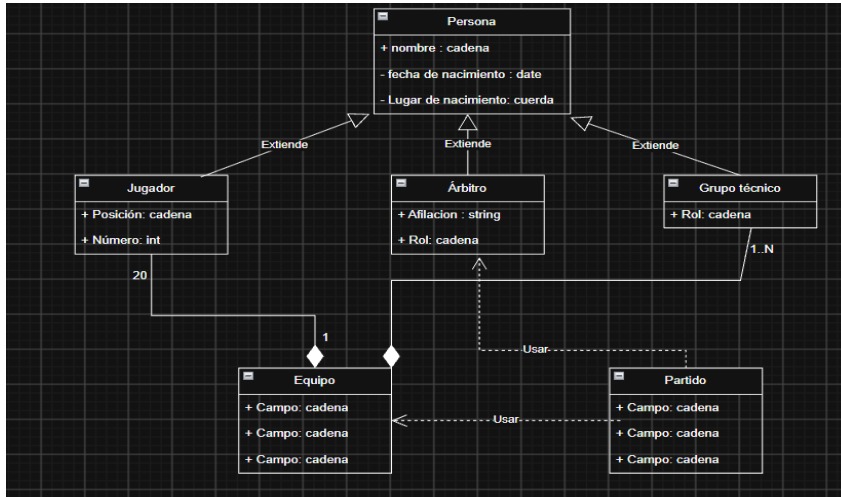

In this diagram of use cases I learned how classes and actors are connected as well as learning to identify in which part of the diagram a dependency or a relationship should go. Although at first glance I am a little confused by the types of connections

"Here we represent what users can do in the purchasing system. The "Customer" is the main actor who initiates the 'Purchase'. The important thing is that we show how the "Purchase" use case mandatorily includes other steps such as "Request credit" and "Delivery", making it clear which processes depend on which.

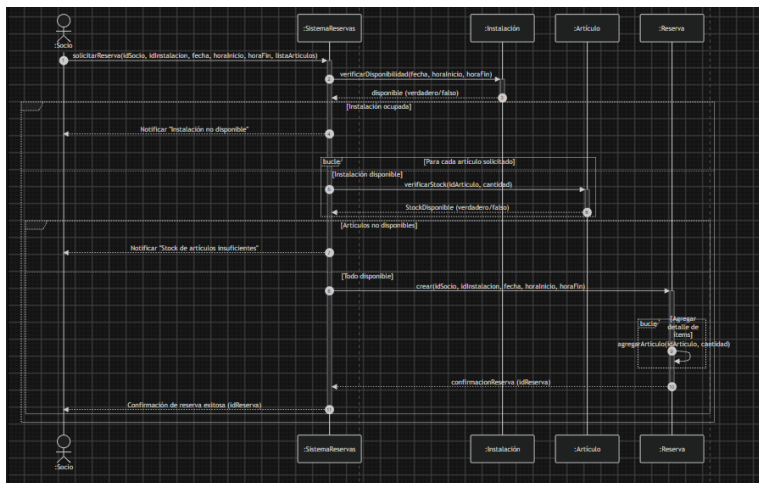

Class Diagram (Football Matches)

In order to be able to carry out the football system, we organize everything by separating the roles. The "Person" class is the base, and from there come "Player", "Referee" and "Technical Group". We also perform the interpretation of how they are related: a "Team" is composed of "Players" and uses a "Referee" in a "Match", using aggregation and association relationships.

Sequence diagram (Court rental)

In this sequence diagram it shows our interpretation to solve the problem raised, using the elements that we saw in class such as the "lifeline", the types of messages and activation bar" etc and if we manage to graph what happens when a "Member" wants to make a reservation. It shows the exact order of the messages: first the member asks for the reservation, then the system checks availability with the "Installation" and the "Item", and if everything is free, it creates the final reservation. It is essential to understand the flow of information over time as the teacher mentioned in previous classes.

Class Diagram (Car Reservation)

In this diagram we saw a diagram of how the car rental of a company X works. We define the central class as "Reservation", which joins the "Customer" with the "Car" that is going to be rented. We use associations to indicate that a reservation belongs to a customer and what attributes are included in the car that is being rented, in addition to declaring the data of each one, such as the ID of the customer or the license plate of the car.
